'ps_synth2.ipt 'IOU-cons1. GNS3 is a simple network simulator software and is used as a valuable
tool for home users to learn about networking and network security issues. GNS3 is designed to
enable users to modify and manipulate any Cisco's IOU based devices without the need for more
software. It is free and open source. GNS3 is able to emulate the complete Cisco IOS environment
without any hardware. It emulates from the top of the Cisco IOS protocol stack with a CLI interpreter
and the full Cisco IOS application stack to the hardware. GNS3 is therefore a full Cisco IOS
environment, but runs on ordinary PC hardware. The author of this post is the administrator of the
Public Subnet Portal and an active community member, but the opinions expressed in this article are

ISA 10019 - 5(e) - Interoperability FK-ISSU21-E, FK-ISSU21-E-1, FK-ISSU21-E-3 and FK-ISSU21-E-4 / FK-
Cisco-ISSU2 - The following commands allow the automated creation of IOS templates within Cisco
IOS Release 12.1(X) Adaptive Security Appliance 5540: Arista says they don't create multi-word
commands, although they do. What they do create are near copies of some of our copyrighted multi-
word commands. Like the simple copy, these multi-word commands have a context that makes them
unique and ancillary to Cisco; the inclusion of them in Arista isn't for any technical reason, and so it's
an unlawful seizure.
