Ficoll-Hypaque (Pharmacia-Biotech, Sweden) density gradients were used to isolate total RNAs. RNAs were dissolved in 40 ul of 2 mM diethyl pyrocarbonate-treated water and stored at -70C until further use. First strand cDNA was synthesized from 2 µg of total RNA using a kit (Gibco/BRL). And for real-time PCR reactions, Sybr Green PCR Kit (TAKARA, Japan) was used following the manufacturer's protocol. The primers used for detection of gene expression were designed using Primer Express 2.0 (Applied Biosystems, Foster City, CA, USA) and were as follows: CPTIA: forward 5' -CGCGGTTCTGCTCCTTC-3'; reverse 5'-ATGTAGGGCGAGGTCGAG-3'; CYP39: forward 5'-TCTCGGGCAGCATTACGT-3'; reverse 5'-TTGATGGCAGAGGCTCCAA-3'; CYP6Z8: forward 5'-ACCCCAATGTTCTCCATGAG-3'; reverse 5'-AAGCAGTGAGGGGATTGCTG-3'; CYP9Q8: forward 5'-AGTCTTACAAGCAGCACCA-3'; reverse 5'-TAGGACGAGCAGCGTTACCT-3'; CYP1J0: forward 5'-GGGCCTGCTGAAGCCGAAT-3'; reverse 5'-GCTCCCCAGTGAGCATCGA-3'; CPTB: forward 5'-GAACCCCTCCTCCTCTC-3'; reverse 5'-AGGAGGACATGTGGGAC-3'; CYP4: forward 5'-CAATCCACGCTTCTGGAAT-3'; reverse 5'-CCCAGTGCCAAGCCCCTGC-3'; CYP6C8: forward 5'-TCAGGATCGGTGTGCCGGA-3'; reverse 5'-GCTGATGTCAGATCCGCTC-3'; CYP39: forward 5'-CAATCCACGCTTCTGGAAT-3'; reverse 5'-GCTGATGTCAGATCCGCTC-3'. r type final jpn iso. From approximately 5 days after emergence, flies were provided with oviposition substrate in the form of 100 g of cattle manure in a 100 mm petri dish. Flies were allowed to oviposit for a 4-hour period every 48 hours over 3 weeks. Eggs were separated using a modified suspension method described in the final section

## **R Type Final Jpn Iso**

When looking at the kinetics of microbial populations, housefly eggs can be incorporated into manure in a high level of addition to provide microbial inoculum for the manure, and allow for potential high microbial degradation rates. The addition of eggs at 30% provides a high level of inoculum when first incorporated; however, this level of egg addition was lowest at the very end of the incubation period (see Table 2). At the end of the 24-h incubation period, the addition of eggs at 30% and 40% was associated with an overall increase of 23.6% in the number of microbial populations (*E. faecium*), and a decrease of 18.1% (*E. coli*). The addition of eggs at the end of the incubation may be related to limitations of microbial populations that decrease when the egg addition occurs. Either way, the concept of eggs incorporation into manure at a high level in parallel with the highest level of microbial populations at initial fermentation is a feasible concept to be investigated further. The concept of using housefly larvae to assist with manure degradation and increase economic value may be further explored by looking at the possibility to include functional components that do not exist in sterile conditions, like biofloc forming bacteria. Poultry litter is a difficult waste to bioconvert due to a high number of additives needed to achieve optimal bioconversion conditions [5ec8ef588b
