Isn't this true with every new release of Photoshop, it's been like that for years. This time around you get a whole heap of stuff thrown at you, at least for starters. And the odd thing is that some features are turned off by default and I tried to spot what they were and how they were turned off. For example, the ability to resize using the rectangle selection tool, drag a corner to resize, this was turned off by default.

Recently when they did a complete rebuild of the UI they introduced a drag and drop resizing function which was probably thrown in before they anticipated the backlash. They probably thought, what the hell, let's give people something they like. But I don't think that it did much to improve operations. The whole job of starting to resize is not streamlined; you have to create a selection and make it draggable; then once you drag it the sometimes unexpected resize pop-up menu opens with the tiny text and small scale. I really don't think that this is user friendly and probably doesn't have anything to do with any real gain in efficiency. All in all the resize feature is probably the least functional operation in the whole program. Note that the other big change is what they have done to contextual menus, which don't always work correctly. Photoshop used to work so well, at least when I first used it back in the early 2000s. Then they got religion and gave us layers. Luckily, if you're already sticking with Lightroom 4, the new version is almost invisible. There is, however, a chance that your digital image library will not form, because the new version sticks around as Lightroom 5.0.0 for a week or two. Before you panic, you can always remove the new version by restoring your catalog to the last consistent version. You can only get away with this if you're sure that the new version will never be important to you.
